Electrostatic Spraying Is the New Standard in Infection Control

By using an electrostatic sprayer, our staff can quickly and efficiently disinfect and sanitize hard-to-reach surfaces.

Our EPA Approved Disinfectant for COVID-19 not only reaches visible areas, but also reaches beyond the front surface to coat the underside and backside of objects. This ensures complete coverage and dwell time in order to meet required kill claims.

As the chemical exits the electrostatic sprayer, it is atomized and given an electrical charge. The charged droplets then travel toward the targeted surface and become attracted to it. Not only will the spray seek out surface area, but each droplet will also seek out its own surface area that hasn't been covered yet.

As a result, the attraction you get with the electrostatic spray droplets creates a 360-degree wraparound effect on surfaces, as opposed to just coating the front side of an object.

Electrostatic sprayers apply chemicals in an efficient, controlled manner, thereby eliminating the danger of chemicals being overused or improperly applied.

Thorough cleaning followed by the superior coverage of electrostatic spraying with our EPA-registered disinfectant delivers a powerful one-two punch in your fight against infection.
